

Transient Shaper

Validation summary for the submitted Windows VST3 build.

OVERALL: PASS - CMake Release builds succeeded for VST3 and Standalone. pluginval 1.0.4 strictness level 5 completed with SUCCESS and exit code 0.

Build environment

Item	Recorded value
Platform	Windows x64; Windows SDK 10.0.26100.0
Build	CMake 4.4.3; MSBuild / Visual Studio Build Tools 18.9.1; Release configuration
Targets	MySynth_VST3 and MySynth_Standalone; both completed successfully
VST3 metadata	Transient Shaper, Archie DSP, version 0.0.1; Fx Dynamics; x86_64-win
Validator	pluginval 1.0.4, strictness level 5; official Tracktion Windows release

Automated pluginval coverage

pluginval scanned the VST3 bundle and found one plug-in. It passed cold and warm loading, plug-in information, editor creation, editor while processing, audio processing, state, automation, editor automation, automatable parameters and bus/layout checks. The full run ended with SUCCESS.

Audio processing and automation were exercised at 44.1, 48 and 96 kHz with block sizes 64, 128, 256, 512 and 1024 samples (15 rate/block combinations per run). The tested configurations completed without reported failures.

Selected results

Check	Result
Plugin scan / load	PASS - one VST3 discovered; cold and warm opens passed.
Audio processing	PASS - 15 sample-rate/block-size combinations at strictness 5.
State and automation	PASS - plugin state, parameter automation and editor automation completed.
Editor and buses	PASS - editor creation and mono/stereo bus checks completed.

Limitations and test interpretation

The pluginval run is automated compatibility and lifecycle validation. It does not prove subjective sound quality, long-session reliability in every DAW, correct device routing, or the absence of every real-time allocation in every code path. No supported DAW was launched for an end-to-end listening session in this test run.

One optional check was skipped: pluginval reported that its VST3 validator executable path was not configured. The rest of the pluginval suite still completed and returned SUCCESS. The project also has no registered CTest tests; an earlier CTest inventory reported zero tests. The report therefore relies on pluginval rather than a project-owned unit-test suite.

What the result establishes

- The x64 VST3 binary was discoverable and loadable by pluginval.
- The editor could be created, including while processing, without pluginval reporting a failure.
- The plugin processed audio across the sample rates and block sizes listed on page 1.
- State, parameter automation, editor automation and bus-layout checks completed.

Not covered

- Listening comparisons, gain-matched quality review, clipping analysis with real program material, CPU benchmarking and long-duration soak tests.
- DAW-specific scans and installation/uninstallation through the Windows setup on a separate clean machine.
- A separate Steinberg VST3 Validator run; the pluginval integration reported that validator path as unset.

Reproduction

Build the Release VST3 target, then run pluginval with `--strictness-level 5 <path-to-Transient-Shaper.vst3>`. The official pluginval documentation describes the strictness levels and headless command-line behavior. Source and build configuration: <https://github.com/amitabhsarkarwya/transient> (commit e3a6e81).

External validator reference: <https://github.com/Tracktion/pluginval> (release v1.0.4; strictness level 5).
